

# Total cost of ownership calculator

The 'Total Cost of Ownership' calculator is a first-generation excel tool from the Mærsk Mc-Kinney Møller Center for Zero Carbon Shipping that allows the user to create simple, bespoke vessel comparisons. By changing variables like vessel type, engine configuration, fuel type and energy efficiency measures the user can investigate the resulting impact on CAPEX/OPEX and emissions footprint. It is also possible to analyze e.g. the level of carbon tax required to bridge a given cost gap between alternative and fossil fuels.

Subject to our terms and conditions, the tool is available free of charge and access can be requested via [this form](#).
